

Minerals and the Body

Janice R. Hermann, Ph.D., RD/LD
Nutrition Specialist

Many people think minerals and vitamins are the same, but they are not. Minerals, like vitamins, are important nutrients found in foods. The main difference is that vitamins are organic substances (meaning that they contain the element carbon) and minerals are inorganic substances. Minerals are needed for many things in addition to eating them in the form of nutrients in foods. The iron and copper in cookware or tools are the same minerals found in food. That is why cooking in a cast iron skillet can provide iron in the diet. When cooking food in an iron skillet, a little bit of the iron comes off and mixes with the food. People can absorb and use it just like iron that is already in food. Minerals are the most permanent part of living things. They do not burn, and, in fact, they can be found in the ashes of something that has burned.

Major and Trace Minerals

There are two groups of minerals, major minerals and trace minerals. Major minerals are needed in the diet in amounts of 100 milligrams (mg) or more each day. A milligram is a very small amount. It is one thousandth of a gram, and there are 28 grams in an ounce. The major minerals are calcium, phosphorus, magnesium, sulfur, potassium, sodium, and chloride. We need the trace minerals in smaller amounts (less than 100 mg each day). Some trace minerals are iron, iodine, zinc, fluoride, selenium, copper, chromium, manganese, and molybdenum.

Uses of Minerals

The body contains many different minerals. Minerals by themselves are inactive chemical elements, like the iron in a pan or calcium in a rock. But in the body, calcium is used to make the bones and teeth, and iron is used to make the hemoglobin in red blood cells. The body uses this iron to carry oxygen to its cells. Additional minerals help in many other body processes:

- Minerals become part of tissue structure, like in bone and teeth.
- Minerals help maintain acid-base balance, to keep the body pH neutral.
- Minerals help regulate body processes, such as in enzyme systems.
- Minerals function in nerve impulse transmission and muscle contraction.
- Minerals help release energy from food.

Electrolytes

Sodium, potassium and chloride are minerals that are called "electrolytes." In the body, they work to maintain water balance and provide the correct pressure between cells and their surrounding fluids. Sodium and chloride are the major electrolytes in the fluid that surrounds body cells. Potassium is the primary

electrolyte within body cells. Table salt is the most common food that contains both chloride and sodium. Most people consume more than enough sodium. In fact, many health experts believe that consuming too much sodium from salt and a high salt intake may contribute to high blood pressure in people who are "sodium sensitive."

Mineral Toxicity

Minerals can build up in the body, and they can be toxic and cause harmful effects. To avoid this possibility, never take individual mineral supplements unless your doctor prescribes them. Also, make sure to keep supplements that contain minerals in a safe place so children cannot accidentally eat them. A young child can get iron toxicity from taking several adult iron supplements at one time.

Minerals and the USDA MyPlate Food Groups

Minerals are present in foods in different amounts, and all foods do not contain the same minerals. This is why people need to eat a variety of foods from all of the USDA MyPlate food groups. The Table 1 shows which minerals are found in the different USDA MyPlate food groups.

Table 1. Minerals Supplied by the USDA Daily Food Plan Food Groups.

| Food Group | Minerals Supplied |
|---------------|--|
| Dairy | Calcium, magnesium, phosphorus, and potassium |
| Protein Foods | Iron, copper, zinc, chromium, magnesium, potassium, phosphorus, and sulfur |
| Fruit | Magnesium, manganese, and potassium |
| Vegetable | Potassium, magnesium, iodine, and selenium |
| Grain | Iron, copper, zinc, manganese, magnesium, molybdenum, chromium, and phosphorus |

As Table 1 shows, a variety of foods from each of the USDA MyPlate food groups is required to provide the minerals needed. The following table will help provide information on the function and best sources of minerals.

Table 2. Minerals: Sources and Functions

| Mineral | Function | Food Sources |
|---------------------------------------|--|--|
| Summary of Major Minerals | | |
| Calcium (Ca) | Aids in formation of bones and teeth, normal blood clotting, muscle contraction and relaxation, heart function, and nerve function | Milk and other dairy products, greens, broccoli, salmon, sardines, legumes. |
| Phosphorus (P) | Aids in formation of bones and teeth. Regulates release and use of body energy. Helps carry fat in the body as a part of phospholipids. Helps maintain normal acid/base balance in the body. | Meat, fish, poultry, eggs, milk, cereal products. |
| Magnesium (Mg) | Necessary for muscle contraction and nerve function. | Meat, seafood, nuts, legumes, dairy products, whole grains. |
| Sodium (Na) | Important component of body fluids, mostly outside cells. | Table salt, meat, seafood, milk, cheese, eggs, baking soda, baking powder, bread, vegetables, processed foods. |
| Potassium (K) | Important component of body fluids, mostly inside cells. | Potatoes, melons, citrus fruit, banana, and most fruits and vegetables, meat, milk and legumes. |
| Summary of Some Trace Minerals | | |
| Iron (Fe) | Found in hemoglobin in red blood cells and myoglobin in muscle cells. Needed to carry oxygen. | Liver, meats, egg yolks, nuts, enriched or whole grains, legumes. |
| Iodine (I) | Part of thyroid hormones (thyroxin and triiodothyronine). | Seafood, iodized salt. |
| Selenium (Se) | Acts as an antioxidant. | Grains, meat, poultry, fish, dairy products. |
| Zinc (Zn) | Part of important enzyme systems Found in the hormone insulin. | Meat, seafood, whole grains. |
| Chromium (Cr) | Helps body use insulin. | Liver, brewer's yeast, whole grains, nuts, cheeses. |
| Copper (Cu) | Part of many enzymes. | Legumes, grains, nuts, seeds, organ meat. |
| Fluoride (F) | Part of teeth and bone. Helps prevent cavities in teeth. | Fluoridated drinking water, fish, tea. |

Oklahoma State University, in compliance with Title VI and VII of the Civil Rights Act of 1964, Executive Order 11246 as amended, and Title IX of the Education Amendments of 1972 (Higher Education Act), the Americans with Disabilities Act of 1990, and other federal and state laws and regulations, does not discriminate on the basis of race, color, national origin, genetic information, sex, age, sexual orientation, gender identity, religion, disability, or status as a veteran, in any of its policies, practices or procedures. This provision includes, but is not limited to admissions, employment, financial aid, and educational services. The Director of Equal Opportunity, 408 Whitehurst, OSU, Stillwater, OK 74078-1035; Phone 405-744-5371; email: eeo@okstate.edu has been designated to handle inquiries regarding non-discrimination policies; Director of Equal Opportunity. Any person (student, faculty, or staff) who believes that discriminatory practices have been engaged in based on gender may discuss his or her concerns and file informal or formal complaints of possible violations of Title IX with OSU's Title IX Coordinator 405-744-9154.
